

PHASE 7 – PROJECT DOCUMENTATION

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Project Overview

This project implements a Script-Controlled Access Control List (ACL) in ServiceNow to restrict or allow record access based on a specific field value. The solution provides field-based access control for ServiceNow records.

2. Problem Statement

Records in a ServiceNow application may require different access permissions depending on their field values. Without appropriate access control, users may receive access to records that they are not authorized to view or modify.

3. Proposed Solution

A Script-Controlled ACL is implemented to evaluate the required field value. Based on the defined condition, the system allows authorized access and restricts unauthorized access.

4. Technologies Used

- ServiceNow Platform
- JavaScript
- Access Control List (ACL)
- ServiceNow Developer Instance

5. Implementation Summary

The required ServiceNow configuration was completed and an ACL was created with JavaScript-based access logic. The ACL evaluates the selected field value and controls record access according to the defined condition.

6. Testing Summary

The implemented ACL was tested using different field values and access conditions. The tests verified that authorized access is permitted and unauthorized access is restricted.

7. Benefits

- Improves record security.
- Prevents unauthorized access.
- Provides field-based access control.
- Helps manage ServiceNow records securely.

8. Conclusion

The Script-Controlled ACL project was successfully developed and tested in ServiceNow. The solution demonstrates how field values can be used to control access to records and provide an additional layer of security.

9. Supporting Evidence

Screenshots of the ServiceNow configuration, ACL implementation, testing results, and final output can be included in this documentation to demonstrate the completed project.
