

PHASE 8 – PROJECT DEMONSTRATION

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Introduction

The completed project was demonstrated using the ServiceNow platform. The demonstration explains the purpose of the project, its working process, and the final output.

2. Project Purpose

The main purpose of this project is to control access to ServiceNow records based on a specific field value. This helps ensure that records are accessed only when the defined condition is satisfied.

3. Demonstration Process

The following steps were demonstrated:

- Introduction of the project title.
- Explanation of the project objective.
- Opening the ServiceNow project environment.
- Showing the required table and records.
- Displaying the configured Access Control List (ACL).
- Explaining the script used in the ACL.
- Showing how the field value is checked.
- Demonstrating the access granted when the condition is satisfied.
- Demonstrating the access restriction when the condition is not satisfied.
- Showing the final working output.

4. Working Demonstration

During the demonstration, different field values were used to verify the access-control functionality. The ACL checks the field value and applies the defined access condition accordingly.

5. Final Output

The project successfully controls record access based on the specified field value. The demonstration confirms that the implemented ACL works according to the project requirements.

6. Benefits

- Improves record security.
- Helps prevent unauthorized access.
- Provides field-based access control.
- Makes access management more controlled.
- Supports secure record handling in ServiceNow.

7. Conclusion

The project was successfully implemented and demonstrated in ServiceNow. The Script-Controlled ACL provides a practical method for restricting record access based on field values and fulfills the intended project objective.
