

PHASE 6 – PROJECT TESTING

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Testing Overview

The implemented Script-Controlled ACL was tested in the ServiceNow platform to verify whether record access is correctly controlled according to the specified field value.

2. Testing Objectives

- Verify that the ACL condition works correctly.
- Check access for valid and invalid field values.
- Confirm that unauthorized access is restricted.
- Verify that authorized access is allowed.

3. Test Cases

Test Case	Condition	Expected Result	Status
TC-01	Field value satisfies the access condition	Record access is allowed	Pass
TC-02	Field value does not satisfy the access condition	Record access is restricted	Pass
TC-03	User attempts to access a restricted record	Unauthorized access is denied	Pass
TC-04	User accesses an authorized record	Authorized access is provided	Pass

4. Testing Result

The test cases were executed using different field values and access conditions. The ACL behaved according to the defined access rules, allowing authorized access and restricting unauthorized access.

5. Conclusion

Testing confirmed that the Script-Controlled ACL provides field-based record access control as intended. The project functionality was verified successfully in the ServiceNow environment.
